Rasoi · Growth Recommendation — Data Analyst Intern Take-Home

One-page summary · recommendation first · evidence second · caveats last

RECOMMENDATION

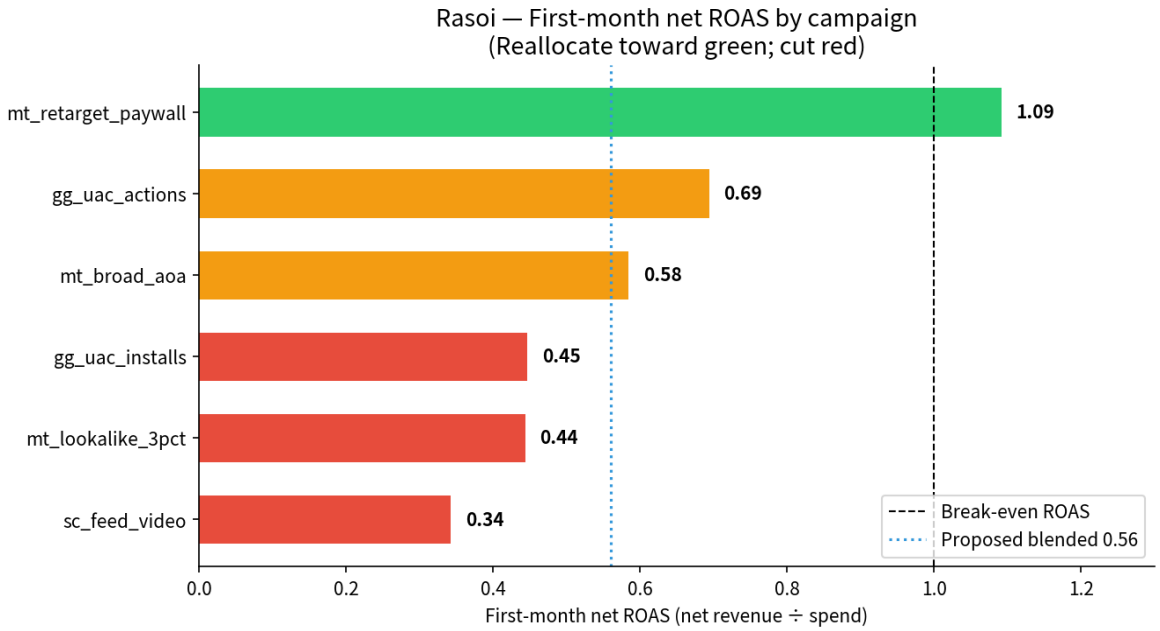

Allocate the ■1 Cr next-month budget as: mt_broad_aoa 28%, gg_uac_actions 25%, gg_uac_installs 18%, mt_retarget_paywall 12%, mt_lookalike_3pct 12%, sc_feed_video 5%. Kill (or park) ShareChat. Expect ~14,000 paying users and first-month net revenue ≈ ■56.7 L (blended ROAS 0.57).

Steering metric week-to-week: **first-month net ROAS** (net revenue ÷ spend). It folds conversion, plan mix and refunds into one cash-relevant number that is observable with a one-day lag.

PROPOSED SPEND TABLE

Campaign	Spend (■)	Trials	Payers	Net Rev (■)	ROAS
mt_broad_aoa	28,00,000	12,439	3,842	15,62,489	0.56
gg_uac_actions	25,00,000	9,530	3,200	14,77,658	0.59
gg_uac_installs	18,00,000	8,129	2,204	8,03,771	0.45
mt_retarget_paywall	12,00,000	6,413	2,278	11,15,023	0.93
mt_lookalike_3pct	12,00,000	13,589	1,907	5,35,822	0.45
sc_feed_video	5,00,000	2,793	601	1,71,283	0.34
TOTAL	**1,00,00,000**	**52,893**	**14,032**	**56,66,046**	**0.57**

THE ONE CHART

Shift budget from red bars (ShareChat, Lookalike, UAC-Installs) toward green (Retarget) and amber (Actions, Broad) until retarget audience saturates.

EVIDENCE (key metrics, full period, anomaly-excluded)

Campaign	CPT	CAC	Trial→Paid	Annual Mix	ROAS
mt_retarget_paywall	■159	■448	35.5%	30%	1.09
gg_uac_actions	■223	■665	33.6%	27%	0.69
mt_broad_aoa	■214	■695	30.9%	22%	0.59
gg_uac_installs	■221	■816	27.1%	17%	0.45
mt_lookalike_3pct	■88	■633	14.0%	8%	0.44
sc_feed_video	■179	■832	21.5%	9%	0.34

Lookalike is cheapest on CPT but a trap: only 14% convert to paid and almost none take annual → ROAS 0.44. Retarget is the clear winner on every value metric.

DATA ISSUE & CAVEATS

One real problem: 19–24 Jul Google campaigns show normal spend/installs but trials/renewals/revenue collapsed ~98%. Handling: excluded those 12 rows from all ratio metrics (kept spend & installs). Likely purchase-tracking outage. Would ask engineering for the MMP event log and any Google Ads conversion API downtime before trusting Google numbers for live budget.

Assumptions: historical CPT / lag-matched trial→paid / net-rev-per-payer hold after mild diminishing returns (5–15% when scaling 1.5–2.5×). No seasonality or competitive shift modelled. First-month ROAS is a cash proxy, not full LTV. Kill decision on ShareChat would be reversed by a holdout showing high incremental LTV or unique audience value.
